FIG. 50: SOLAR EXPLOSION
A shock wave in space generated by a solar eruption. The sketch shows the fully ionized nucleons attached to the solar magnetic field lines acting as the driving piston for the shock wave. (Courtesy: UTIAS, after Gold, 1962).
FIG. 22: EXPLOSION FROM A 20-TON HEMISPHERE OF TNT

The blast wave S and fireball F, from a 20-ton TNT surface explosion are clearly shown. The backdrops are 50 feet by 30 feet and in conjunction with the rocket smoke trails, it is possible to distinguish shock waves and particle paths and to measure their velocities. Owing to unusual daylight conditions, the hemispherical shock wave became visible. (Courtesy: Defence Research Board of Canada).

Fundamental Theorem in Differential Geometry:
There exists a surface in $\mathbb{R}^3$ with 1st and 2nd fundamental form coefficients $\{g_{ij}\}$ and $\{h_{ij}\}$, $\{g_{ij}\}$ being positive definite, provided that the coefficients satisfy the Gauss-Codazzi system.

*This theorem holds even when $h_{ij} \in L^p$ (Mardare 2003–05)

Given $\{g_{ij}\}$, $\{h_{ij}\}$ is determined by the Codazzi Eqs. (Compatibility):

$$
\begin{align*}
\partial_x M - \partial_y L &= L\Gamma_{22}^{(2)} - 2M\Gamma_{12}^{(2)} + N\Gamma_{11}^{(2)}, \\
\partial_x N - \partial_y M &= -L\Gamma_{22}^{(1)} + 2M\Gamma_{12}^{(1)} - N\Gamma_{11}^{(1)},
\end{align*}
$$

satisfying the Gauss Equation (Constraint):

$$
LN - M^2 = K,
$$

where $L = \frac{h_{11}}{\sqrt{|g|}}$, $M = \frac{h_{12}}{\sqrt{|g|}}$, $N = \frac{h_{22}}{\sqrt{|g|}}$, $|g| = g_{11}g_{22} - g_{12}^2$

$\Gamma_{ij}^{(k)}$—Christoffel symbols, depending on $g_{ij}$ up to their 1st derivatives

and the Gauss Equation becomes the Bernoulli Relation:

\[ p = -\sqrt{q^2 + K}. \]

Define the sound speed: \( c^2 = p'(\rho). \) Then \( c^2 = 1/\rho^2 = q^2 + K. \)

- \( c^2 > q^2 \) and the “flow” is subsonic when \( K > 0, \)
- \( c^2 < q^2 \) and the “flow” is supersonic when \( K < 0, \)
- \( c^2 = q^2 \) and the “flow” is sonic when \( K = 0. \)
Fluid Dynamics Formalism for Isometric Embedding

Set \[ L = \rho v^2 + p, \quad M = -\rho uv, \quad N = \rho u^2 + p, \quad q^2 = u^2 + v^2. \]
Choose \( p \) as the Chaplygin type gas: \( p = -1/\rho \).

The Codazzi Equations become the Momentum Equations:

\[
\begin{align*}
\partial_x(\rho uv) + \partial_y(\rho v^2 + p) &= -(\rho v^2 + p)\Gamma_{22}^{(2)} - 2\rho uv\Gamma_{12}^{(2)} - (\rho u^2 + p)\Gamma_{11}^{(2)}, \\
\partial_x(\rho u^2 + p) + \partial_y(\rho uv) &= -(\rho v^2 + p)\Gamma_{22}^{(1)} - 2\rho uv\Gamma_{12}^{(1)} - (\rho u^2 + p)\Gamma_{11}^{(1)},
\end{align*}
\]
and the Gauss Equation becomes the Bernoulli Relation:

\[ p = -\sqrt{q^2 + K}. \]

Define the sound speed: \( c^2 = p'(\rho) \). Then \( c^2 = 1/\rho^2 = q^2 + K \).

\( c^2 > q^2 \) and the “flow” is subsonic when \( K > 0 \),
\( c^2 < q^2 \) and the “flow” is supersonic when \( K < 0 \),
\( c^2 = q^2 \) and the “flow” is sonic when \( K = 0 \).

Gauss-Codazzi-Ricci System for Isometric Embedding of \(d\)-D Riemannian Manifolds into \(\mathbb{R}^N\): \(d \geq 3\)

**Gauss equations:** \(h^a_{ji}h^a_{kl} - h^a_{ki}h^a_{jl} = R_{ijkl}\)

**Codazzi equations:** \[\frac{\partial h^a_{lj}}{\partial x^k} - \frac{\partial h^a_{kj}}{\partial x^l} + \Gamma^m_{lj}h^a_{km} - \Gamma^m_{kj}h^a_{lm} + \kappa^a_{kb}h^b_{lj} - \kappa^a_{lb}h^b_{kj} = 0\]

**Ricci equations:** \[\frac{\partial \kappa^a_{lb}}{\partial x^k} - \frac{\partial \kappa^a_{kb}}{\partial x^l} - g^{mn}\left(h^a_{ml}h^b_{kn} - h^a_{mk}h^b_{ln}\right) + \kappa^a_{kc}\kappa^c_{lb} - \kappa^a_{lc}\kappa^c_{kb} = 0\]

where \(R_{ijkl}\) is the Riemann curvature tensor, \(\kappa^a_{kb} = -\kappa^b_{ka}\) is the coefficients of the connection form (torsion coefficients) on the normal bundle; the indices \(a, b, c\) run from 1 to \(N\), and \(i, j, k, l, m, n\) run from 1 to \(d \geq 3\).

- Let \((h_{ij}^{a,\varepsilon}, \kappa_{lb}^{a,\varepsilon})\) be a sequence of solutions to the Gauss-Codazzi-Ricci system, which is uniformly bounded in \(L^p, p > 2\). Then the weak limit vector field \((h_{ij}^{a}, \kappa_{lb}^{a})\) of the sequence \((h_{ij}^{a,\varepsilon}, \kappa_{lb}^{a,\varepsilon})\) in \(L^p\) is still a solution to the Gauss-Codazzi-Ricci system.

- There exists a minimizer \((h_{ij}^{a}, \kappa_{lb}^{a})\) for the minimization problem:

\[
\min_{S} \|(h, \kappa)\|_{L^p(\Omega)}^p := \min_{S} \int_{\Omega} \sqrt{|g|} \left( |h_{ij} h_{ij}|^\frac{p}{2} + |\kappa_{lb} \kappa_{lb}|^\frac{p}{2} \right) dx,

The weak limit of isometrically embedded surfaces is still an isometrically embedded surface in $\mathbb{R}^d$ for any Riemann curvature tensor $R_{ijkl}$ without restriction.

Weak Continuity of Determinants ⋯

Stronger Compactness Framework for the Gauss-Codazzi-Ricci System (CSD 2010): Given any sequence of approximate solutions to this system which is uniformly bounded in $L^2$ and has reasonable bounds on the errors made in the approximation (the errors are confined in a compact subset of $H^{-1}_{loc}$), then the approximating sequence has a weakly convergent subsequence whose limit is still a solution of the Gauss-Codazzi-Ricci system.
Nonlinear Partial Differential Equations of Mixed Hyperbolic-Elliptic Type, or even No Type, naturally arise in many fundamental problems in

Fluid Mechanics
Differential Geometry
Elasticity, Relativity, String Theory
Optimization, Dynamical Systems

The solution to these fundamental problems in the areas greatly requires a deep understanding of

Nonlinear Partial Differential Equations of Mixed Hyperbolic-Elliptic Type
During the last half century, the two different types of nonlinear PDEs have been separately studied. Focuss: Mathematical tools to understand different properties of solutions; Great progress has been made.

With these achievements, my message is that it is the time: To revisit/attack the nonlinear PDEs of mixed type; To explore possible unifying mathematical approaches ideas, and techniques to deal with such problems. In particular, I have presented several fundamental examples of such PDEs, which indicate that some of the mixed-type problems have been ready to be tractable.

Many important mixed-type problems are wide open and very challenging, which require further new ideas, approaches, techniques, ..., and deserve our special attention and true effort.
